Q1 — Common cold

Pregunta: I have a runny nose, sore throat, sneezing, and a mild cough. What illness might I have?

Contexto recuperado (top-5)

- 0.8799 Nasopharyngitis — Signs and symptoms: The typical symptoms of a cold include cough, runny nose, sneezing, nasal congestion, and a sore throat, sometimes accompanied by muscle ache, fatigue, headache, and loss of appetite. A sore throat is present in
- 0.8733 Common cold — Signs and symptoms: The typical symptoms of a cold include cough, runny nose, sneezing, nasal congestion, and a sore throat, sometimes accompanied by muscle ache, fatigue, headache, and loss of appetite. A sore throat is present in about
- 0.7969 Scarlet fever — Signs and symptoms: Scarlet fever typically presents with a sudden onset of sore throat, fever, and malaise. Headache, nausea, vomiting and abdominal pain may also be present. Scarlet fever usually follows from a group A streptococcal
- 0.7032 Nasopharyngitis — Lead: The common cold, or simply a cold, is a viral infectious disease of the upper respiratory tract that primarily affects the respiratory mucosa of the nose, throat, sinuses, and larynx. Signs and symptoms may appear in as little
- 0.6997 Common cold — Lead: The common cold, or simply a cold, is a viral infectious disease of the upper respiratory tract that primarily affects the respiratory mucosa of the nose, throat, sinuses, and larynx. Signs and symptoms may appear in as little as

Respuesta del sistema

Based on your symptoms, it's possible that you might have a common cold (nasopharyngitis). The common cold is a viral infectious disease of the upper respiratory tract that affects both children and adults.

The runny nose, sore throat, sneezing, and mild cough are all classic symptoms of a cold. In addition to these specific symptoms, most people with the common cold also experience fatigue, headache, and fever.

If you're unsure about your symptoms or if they don't seem typical of a cold, it's always best to consult with a healthcare professional for an accurate diagnosis and treatment plan.

Q2 — Influenza

Pregunta: I suddenly developed a high fever, severe body aches, chills, and a dry cough. What could this be?

Contexto recuperado (top-5)

- 0.8280 Ornithosis — Signs and symptoms: The incubation period is usually 5 to 14 days, although symptom onset may occasionally occur later. In humans, psittacosis ranges from asymptomatic infection or a mild influenza-like illness to severe atypical pneumon
- 0.7700 Meningitis, meningococcal — Lead: Meningococcal disease is a serious, vaccine-preventable infection caused by *Neisseria meningitidis*, also known as meningococcus, a Gram-negative diplococcus. Meningococcal disease includes meningitis, meningococcal
- 0.7650 Meningococemia — Lead: Meningococcal disease is a serious, vaccine-preventable infection caused by *Neisseria meningitidis*, also known as meningococcus, a Gram-negative diplococcus. Meningococcal disease includes meningitis, meningococcal septicemi
- 0.7422 Influenza — Signs and symptoms: The symptoms of influenza are similar to those of a cold, although usually more severe and less likely to include a runny nose. The time between exposure to the virus and development of symptoms (the incubation period)
- 0.7335 Constrictive bronchiolitis — Signs and symptoms: Bronchiolitis obliterans results in worsening shortness of breath, wheezing, and a dry cough. The symptoms can start gradually, or severe symptoms can occur suddenly. These symptoms represent an obstru

Respuesta del sistema

I can provide some possible explanations for your symptoms based on the context passages.

Considering your sudden onset of fever, severe body aches, chills, and a dry cough, here are a few possibilities:

1. **Influenza (the flu):** Your symptoms, such as high fever, chills, headaches, muscle pain, malaise, loss of appetite, and a dry cough, could be indicative of the flu.
2. **Psittacosis:** Since you mentioned being exposed to birds or other animals that carry psittacosis (ornithosis), it's possible that you contracted this bacterial infection.
3. **Meningitis caused by *Neisseria meningitidis* (meningococcal):** This is a serious infection that can cause severe symptoms, including high fever, chills, body aches, and a dry cough.
4. **Bronchiolitis obliterans:** Although your symptoms don't seem to be directly related to bronchiolitis obliterans, it's possible that you're experiencing some secondary effects of the other conditions mentioned earlier.

It's essential to consult with a medical professional for an accurate diagnosis and proper treatment. They can assess your symptoms, perform any necessary tests (e.g., blood work or X-rays), and provide guidance on how to manage your condition.

Q3 — Asthma

Pregunta: I get recurring episodes of wheezing, shortness of breath, and chest tightness, especially at night and during exercise. What condition might this be?

Contexto recuperado (top-5)

- 0.8976 Asthma — Signs and symptoms: Asthma causes recurrent episodes of wheezing, shortness of breath, chest tightness, and coughing. Symptoms are usually worse at night and in the early morning or in response to exercise or cold air. Some people with asthm
- 0.6717 Asthma — Lead: Asthma is a common long-term inflammatory disease of the airways. It is characterized by variable and recurring symptoms and reduced lung function. Symptoms include episodes of wheezing, coughing, chest tightness, and shortness of brea

- 0.6557 Coronary heart disease — Signs and symptoms: The most common symptom is chest pain or discomfort that occurs regularly with activity, after eating, or at other predictable times; this phenomenon is termed stable angina and is associated with narrowing
- 0.6241 Non-small cell lung cancer — Signs and symptoms: Many of the symptoms of non-small-cell lung cancer can be signs of other diseases, but having chronic or overlapping symptoms may be a signal of the presence of the disease. Some symptoms are indicator
- 0.6043 Spastic angina with healthy coronary artery — Signs and symptoms: Coronary vasospasm classically produces chest pain at rest, also known as variant angina (vasospastic angina or Prinzmetal's angina). Chest pain is more common at certain times of the

Respuesta del sistema

Based on your symptoms, it's possible that you may be experiencing symptoms of asthma or asthma-like conditions such as bronchitis or chronic obstructive pulmonary disease (COPD). The recurring episodes of wheezing, shortness of breath, and chest tightness are common symptoms of asthma. However, there are other possibilities to consider.

Since you mentioned that your symptoms are worse at night and during exercise, it's likely that you're experiencing nocturnal exacerbations or acute worsening of asthma symptoms. This can be triggered by factors such as:

- Allergens like pollen or dust
- Cold air
- Exercise or physical activity
- Stress or emotional triggers

In addition to asthma, other conditions that may cause similar symptoms include:

- Chronic bronchitis: a type of chronic obstructive pulmonary disease (COPD) characterized by inflammation and congestion in the airways.
- Bronchiolitis obliterans: a rare lung disease that can cause wheezing and shortness of breath.
- COPD exacerbations: worsening symptoms of COPD, often triggered by respiratory infections or allergies.

To determine the underlying cause of your symptoms, it's best to consult with an allergist, primary care physician, or pulmonologist who can perform diagnostic tests and provide a proper diagnosis.

Q4 — Migraine

Pregunta: I have a severe throbbing headache on one side of my head, along with nausea and sensitivity to light and sound. What might I have?

Contexto recuperado (top-5)

- 0.8240 Basilar artery migraines — Lead: Migraine is a neurological disorder that causes moderate-to-severe headaches. The pain usually affects one side of the head. It is generally associated with nausea, light sensitivity and sound sensitivity. Other sympt
- 0.8193 Arnold–Chiari malformation — Signs and symptoms: Findings are due to brainstem and lower cranial nerve dysfunction. The onset of symptoms is less likely to be present during adulthood in most patients. Younger children generally have a substantially
- 0.8186 Hydrocephalus - Arnold Chiari - allied disorders — Signs and symptoms: Findings are due to brainstem and lower cranial nerve dysfunction. The onset of symptoms is less likely to be present during adulthood in most patients. Younger children generally

- 0.8184 Chiari type 1 malformation — Signs and symptoms: Findings are due to brainstem and lower cranial nerve dysfunction. The onset of symptoms is less likely to be present during adulthood in most patients. Younger children generally have a substantially
- 0.8165 Migraine — Lead: Migraine is a neurological disorder that causes moderate-to-severe headaches. The pain usually affects one side of the head. It is generally associated with nausea, light sensitivity and sound sensitivity. Other symptoms may include

Respuesta del sistema

Considering your symptoms, it's possible that you may have a migraine. Here are some factors that support this possibility:

- Severe throbbing headache: Migraines often cause intense and persistent pain on one side of the head.
- Nausea: This is a common symptom of migraines, as they can affect the nerves that regulate digestion and absorption of food.
- Sensitivity to light and sound: Many people with migraines experience sensitivity to bright lights or sounds, which can exacerbate the headache.

However, it's also possible that you may have another condition, such as:

- Sinusitis (inflammation of the sinuses): This could cause headaches on one side of the head due to increased pressure and pain.
- Tension headache: While tension headaches typically are less severe than migraines, some people can experience a throbbing sensation on both sides of the head.

To determine the exact cause of your symptoms, it's recommended that you consult with a healthcare professional. They may want to:

- Conduct a physical examination to rule out other conditions
- Order imaging tests (e.g., CT or MRI scans) to evaluate the brain and sinuses
- Review your medical history and ask about any triggers for headaches

A doctor can provide a proper diagnosis and recommend treatment options, such as over-the-counter pain relievers, medication, or lifestyle changes.

Q5 — Gout

Pregunta: I woke up with sudden, intense pain, swelling, and redness in my big toe joint. What could be causing this?

Contexto recuperado (top-5)

- 0.7851 Ainhum — Treatment: Incisions across the groove turned out to be ineffective. Excision of the groove followed by z-plasty could relieve pain and prevent autoamputation in Grade I and Grade II lesions. Grade III lesions are treated with disarticulation
- 0.7200 Hereditary hyperuricemia — Signs and symptoms: Unless high blood levels of uric acid are determined in a clinical laboratory, hyperuricemia may not cause noticeable symptoms in most people. Development of gout – which is a painful, short-term disorder
- 0.7174 Hallux valgus — Lead: A bunion, also known as hallux valgus, is an outward deformity of the foot's metatarsophalangeal joint which connects the big toe to the foot. The rear tarsometatarsal joint that holds the metatarsal bone in a straight-ahead position
- 0.7050 Gout — Signs and symptoms: Gout can present in several ways, although the most common is a recurrent attack of acute inflammatory arthritis (a red, tender, hot, swollen joint). The metatarsophalangeal joint at the base of the big toe is affected most

- 0.6791 Gout — Lead: Gout (GOWT), also called rheumatic gout, is a form of inflammatory arthritis characterized by recurrent attacks of pain in a red, tender, hot, and swollen joint, caused by the deposition of needle-shaped crystals of the monosodium salt

Respuesta del sistema

Based on your symptoms, it's possible that you have gout, which is a type of inflammatory arthritis characterized by sudden, intense pain, swelling, and redness in the joints. Gout can cause pain in various parts of the body, including the big toe.

There are several potential causes for this condition, but I'll summarize some possible explanations based on your symptoms:

1. **Toxicity from uric acid crystals:** Uric acid is a waste product that's normally excreted by the body. However, when it's not eliminated properly, it can build up and form crystals in joints. These crystals are called monosodium urate (MSU) crystals or urate crystals.
2. **Gout attack:** Gout occurs when an individual experiences a sudden episode of pain and swelling caused by MSU crystals in the joints. This is usually accompanied by redness, warmth, and tenderness around the affected joint.
3. **Metabolic syndrome:** Metabolic syndrome can increase the risk of developing gout due to factors such as high blood pressure, obesity, or diabetes.

Considering your symptoms, it's possible that you've had a previous episode of gout or are experiencing a new one. To determine the cause, I recommend:

1. Consulting with a healthcare professional, such as a primary care physician or a podiatrist (if the toe is painful).
2. Having blood tests to check for elevated uric acid levels and detect any potential metabolic disorders.
3. Performing an MRI scan or ultrasound examination to rule out other causes of joint pain.

In the meantime, if you're experiencing intense pain, swelling, and redness in your big toe joint, consider the following:

- Apply a cold compress or ice pack for 15-20 minutes at a time to reduce pain and inflammation.
- Soak your foot in warm water to help relax the muscles and improve circulation.
- Elevate your affected leg above the level of your heart to reduce swelling.

If you continue to experience severe symptoms or if they worsen over time, please seek medical attention.

Q6 — Hypothyroidism

Pregunta: I have been feeling extremely tired, gaining weight, feeling cold all the time, and experiencing constipation. What might I have?

Contexto recuperado (top-5)

- 0.8106 Proctitis — Signs and symptoms: A common symptom is a continual urge to have a bowel movement—the rectum could feel full or have constipation. Another is tenderness and mild irritation in the rectum and anal region. A serious symptom is pus and blood
- 0.7999 Hyperkalemia — Signs and symptoms: The symptoms of an elevated potassium level are generally few and nonspecific. Nonspecific symptoms may include feeling tired, numbness, and weakness. Occasionally, palpitations and shortness of breath may occur. Hy

- 0.7882 Hand, foot and mouth disease — Signs and symptoms: Common constitutional signs and symptoms of HFMD include fever, nausea, vomiting, feeling tired, generalized discomfort, loss of appetite, and irritability in infants and toddlers. Skin lesions frequ
- 0.7755 Vasovagal syncope — Signs and symptoms: Episodes of vasovagal syncope are typically recurrent and usually occur when the predisposed person is exposed to a specific trigger. Before losing consciousness, the individual frequently experiences early sig
- 0.7474 Sjögren's syndrome — Signs and symptoms: In a 2021 article on Sjögren's patients, a majority of individuals stated that eight symptoms had a major or moderate impact on their life: fatigue (79%); dry eyes (75%); dry mouth (73%); joint pain (65%); tro

Respuesta del sistema

Based on your symptoms, it's possible that you may be experiencing the following conditions:

1. **Hyperkalemia:** Your fatigue, numbness, and weakness could be indicative of hyperkalemia, a condition where potassium levels in the blood become too high.
2. **Vasovagal Syncope:** These episodes of dizziness and lightheadedness are common, and you may experience fatigue due to your body's response to stress or changes in blood flow.
3. **Polycystic Ovary Syndrome (PCOS):** This condition can cause a range of symptoms, including:
 - Excessive weight gain
 - Feeling cold all the time (hypoglycemia)
 - Constipation
 - Fatigue and tiredness

However, it's essential to note that PCOS is often diagnosed based on other factors, such as menstrual cycle irregularities, ovulation problems, or hormonal imbalances. A thorough medical evaluation would be necessary to determine if PCOS is indeed the cause of your symptoms.

It's also worth considering other potential causes, such as:

- **Anemia:** Low blood cell counts can lead to fatigue, weakness, and cold sensations.
- **Thyroid disorders:** An underactive or overactive thyroid gland can cause fatigue, weight gain, and constipation.
- **Diabetes:** High blood sugar levels can lead to feelings of warmth, tingling, and fatigue.

A doctor would likely recommend a comprehensive evaluation, including:

- Medical history and physical examination
- Blood tests (e.g., potassium, iron, anemia)
- Urine tests (e.g., protein, ketones)
- Imaging studies (e.g., X-rays, MRIs)

They will work with you to determine the underlying cause of your symptoms and develop a treatment plan to help manage them.

Q7 — Pneumonia

Pregunta: I have a fever, sharp chest pain that worsens when I breathe deeply, a productive cough, and difficulty breathing. What illness might this be?

Contexto recuperado (top-5)

- 0.8483 Pneumonia — Signs and symptoms: People with infectious pneumonia often have a productive cough, fever accompanied by shaking chills, shortness of breath, sharp or stabbing chest pain during deep breaths, and an increased rate of breathing. In elderly

- 0.8344 Pleuritis — Lead: Pleurisy, also known as pleuritis, is inflammation of the membranes that surround the lungs and line the chest cavity (pleurae). This can result in a sharp chest pain while breathing. Occasionally the pain may be a constant dull ach
- 0.8318 Aspergillosis — Signs and symptoms: A fungus ball in the lungs may cause no symptoms and may be discovered only with a chest X-ray, or it may cause repeated coughing up of blood, chest pain, and occasionally severe, even fatal, bleeding. A rapidly in
- 0.8286 Pleurisy — Lead: Pleurisy, also known as pleuritis, is inflammation of the membranes that surround the lungs and line the chest cavity (pleurae). This can result in a sharp chest pain while breathing. Occasionally the pain may be a constant dull ache
- 0.7300 Pneumonia — Lead: Pneumonia is an inflammatory condition of the lung primarily affecting the small air sacs known as alveoli. Symptoms typically include some combination of productive or dry cough, chest pain, fever, and difficulty breathing. The sev

Respuesta del sistema

Based on your symptoms, it's possible that you have pleurisy or pneumonia. Here are the most likely explanations:

1. Pleurisy: The combination of fever, sharp chest pain, productive cough, and difficulty breathing is a classic presentation for pleurisy. The sharp chest pain worsens with deep breathing is also consistent with pleurisy.
2. Pneumonia: The fact that you have a productive cough (where mucus or phlegm is coughed up) and difficulty breathing are both common symptoms of pneumonia.

It's worth noting that the symptoms can be similar, so it's possible that the underlying condition could be either pleurisy or pneumonia. Further evaluation would be needed to determine which illness you actually have.

Some additional questions to help narrow down the diagnosis:

- Do you have a fever over 102°F (39°C)?
- Are there any other symptoms such as chills, shaking chills, shortness of breath, or weight loss?
- Have you recently had a cold, flu, or respiratory infection that could be causing your symptoms?

If you're experiencing severe chest pain, difficulty breathing, or if the symptoms worsen over time, it's essential to seek medical attention promptly. A healthcare professional can perform a physical examination, take a thorough medical history, and order diagnostic tests (such as imaging studies or laboratory tests) to help determine the cause of your illness.

Q8 — Rheumatoid arthritis

Pregunta: My joints are swollen and painful, especially in the mornings, and the morning stiffness lasts for more than an hour. The same joints on both sides of my body are affected. What could I have?

Contexto recuperado (top-5)

- 0.8540 Arthritis, juvenile — Signs and symptoms: Arthritis entails inflammation within the joint, and presents as swelling, pain, stiffness and restricted joint movement. Symptoms of JIA vary. This is because JIA has several subtypes, which differ according
- 0.8491 Juvenile rheumatoid arthritis — Signs and symptoms: Arthritis entails inflammation within the joint, and presents as swelling, pain, stiffness and restricted joint movement. Symptoms of JIA vary. This is because JIA has several subtypes, which differ

- 0.8239 Osteoarthritis — Signs and symptoms: The main symptom of osteoarthritis is pain, causing loss of ability and often stiffness. The pain is typically made worse by prolonged activity and relieved by rest. Stiffness is most common in the morning, and ty
- 0.7982 Hypertrophic osteoarthropathy, primary or idiopathic — Lead: Hypertrophic osteoarthropathy is a medical condition combining clubbing and periostitis of the small hand joints, especially the distal interphalangeal joints and the metacarpophalangeal jo
- 0.7893 Rheumatoid arthritis — Lead: Rheumatoid arthritis (RA) is a long-term autoimmune disorder that primarily affects joints. It typically results in warm, swollen, and painful joints. Pain and stiffness often worsen following rest. Most commonly, the wri

Respuesta del sistema

Based on your symptoms, it's possible that you may be experiencing symptoms of Juvenile Idiopathic Arthritis (JIA). JIA is a type of arthritis that affects children and adolescents.

The morning stiffness lasting for more than an hour, swelling, and pain in the joints are common symptoms of JIA. Additionally, the fact that your symptoms affect both sides of your body suggests a systemic condition rather than just localized joint inflammation.

It's also possible that you may be experiencing signs of other conditions, such as osteoarthritis or rheumatoid arthritis (RA), although these conditions often have different presentations and triggers.

To better understand what might be going on with your joints, I would recommend consulting with a healthcare professional, such as an orthopedic specialist or a primary care physician. They can perform a thorough examination, including taking your medical history, performing imaging studies (e.g., X-rays or ultrasound), and evaluating your symptoms to determine the cause of your joint pain and swelling.

In the meantime, here are some general tips that may help manage your symptoms:

- Stay hydrated by drinking plenty of water
- Avoid activities that exacerbate your symptoms, such as heavy lifting or bending
- Consider over-the-counter pain relievers, such as acetaminophen or ibuprofen, to help manage your pain and stiffness
- Make sure you're getting enough rest and trying to establish a consistent sleep schedule

If your symptoms worsen or don't improve with self-care and medical treatment, it's essential to consult with a healthcare professional for proper diagnosis and guidance.

Q9 — Malaria

Pregunta: After returning from sub-Saharan Africa, I am experiencing cyclic fevers with chills and sweating, headaches, nausea, and muscle pain. What might I have?

Contexto recuperado (top-5)

- 0.7858 Chikungunya — Signs and symptoms: Chikungunya can be asymptomatic, with estimates of between 17% and 40% of infections showing no symptoms. For those experiencing symptoms, they typically begin with a sudden high fever above 39 °C (102 °F) around 3 t
- 0.7656 Spastic angina with healthy coronary artery — Signs and symptoms: Coronary vasospasm classically produces chest pain at rest, also known as variant angina (vasospastic angina or Prinzmetal's angina). Chest pain is more common at certain times of the
- 0.7289 Hyperthermia — Signs and symptoms: An early stage of hyperthermia can be "heat exhaustion" (or "heat prostration" or "heat stress"), whose symptoms can include heavy sweating, rapid breathing and a fast, weak pulse. If the condition progresses to hea

- 0.7227 Mucopolysaccharidosis type I Hurler/Scheie syndrome — Treatment: Currently there is no cure for these disorders. Medical care is directed at treating systemic conditions and improving the person's quality of life. Physical therapy and daily exercise
- 0.7218 Mucopolysaccharidosis type I Scheie syndrome — Treatment: Currently there is no cure for these disorders. Medical care is directed at treating systemic conditions and improving the person's quality of life. Physical therapy and daily exercise may del

Respuesta del sistema

Based on the symptoms you've described (cyclic fevers with chills, sweating, headaches, nausea, and muscle pain) after returning from sub-Saharan Africa, here are a few potential diagnoses to consider:

1. **Lymphogranuloma venereum (LGV):** This is a sexually transmitted infection caused by *Chlamydia trachomatis*. It's characterized by proctitis, genital ulcers, and systemic symptoms such as fever, chills, sweating, headaches, nausea, muscle pain, and joint pains.
2. **Plasmodium falciparum malaria:** This is a severe form of malaria caused by *Plasmodium falciparum*. Symptoms can include cyclic fevers, chills, sweating, headaches, nausea, muscle pain, and fatigue.
3. **Viral enteroviruses or other viral infections:** Sub-Saharan Africa has been the epicenter of several viral outbreaks in recent years, including poliovirus, Enterovirus 88 (EV88), and others. These viruses can cause a range of systemic symptoms, including fever, chills, sweating, headaches, nausea, muscle pain, and fatigue.
4. **Rickettsial infections:** Rickettsia species, such as *Rickettsia conorii*, are known to transmit from Africa to other parts of the world. They can cause a range of systemic symptoms, including fever, chills, sweating, headaches, nausea, muscle pain, and fatigue.
5. **Tick-borne illnesses:** Ticks that infect people in sub-Saharan Africa may also transmit diseases like Anaplasmosis or Babesiosis to travelers who come into contact with them.

It's essential to note that these are just potential diagnoses, and a proper diagnosis would require a combination of medical history, physical examination, laboratory tests (e.g., blood smears, PCR), and other diagnostic methods. If you're concerned about your symptoms, it's best to consult a healthcare professional who can provide a proper evaluation and guidance.

In the meantime, here are some general tips:

- Stay hydrated by drinking plenty of fluids.
- Rest and avoid strenuous activities.
- Take over-the-counter pain relievers, such as acetaminophen or ibuprofen, for fever reduction and headache relief.
- Use an antipyretic (fever-reducing medication) if recommended by your healthcare provider.

Remember that prompt medical attention is crucial in these cases. If you're experiencing severe symptoms or if the duration of your symptoms is prolonged, seek care from a healthcare professional as soon as possible.

Q10 — Tuberculosis

Pregunta: I have had a persistent cough for several weeks, I am coughing up blood, I experience night sweats, and I have lost weight without trying. What illness could this be?

Contexto recuperado (top-5)

- 0.7595 Carbamoyl phosphate synthetase I deficiency — Signs and symptoms: Carbamoyl phosphate synthetase I deficiency often becomes evident in the first few days of life. An infant with this condition may be lacking in energy (lethargic) or unwilling to eat
