### Q1 — Common cold

**Pregunta:** I have a runny nose, sore throat, sneezing, and a mild cough. What illness might I have?

#### Contexto recuperado (top-5)

- 0.8799 Nasopharyngitis — Signs and symptoms: The typical symptoms of a cold include cough, runny nose, sneezing, nasal congestion, and a sore throat, sometimes accompanied by muscle ache, fatigue, headache, and loss of appetite. A sore throat is present in
- 0.8733 Common cold — Signs and symptoms: The typical symptoms of a cold include cough, runny nose, sneezing, nasal congestion, and a sore throat, sometimes accompanied by muscle ache, fatigue, headache, and loss of appetite. A sore throat is present in about
- 0.7969 Scarlet fever — Signs and symptoms: Scarlet fever typically presents with a sudden onset of sore throat, fever, and malaise. Headache, nausea, vomiting and abdominal pain may also be present. Scarlet fever usually follows from a group A streptococcal
- 0.7032 Nasopharyngitis — Lead: The common cold, or simply a cold, is a viral infectious disease of the upper respiratory tract that primarily affects the respiratory mucosa of the nose, throat, sinuses, and larynx. Signs and symptoms may appear in as little
- 0.6997 Common cold — Lead: The common cold, or simply a cold, is a viral infectious disease of the upper respiratory tract that primarily affects the respiratory mucosa of the nose, throat, sinuses, and larynx. Signs and symptoms may appear in as little as

#### Respuesta del sistema

Based on your symptoms, it's possible that you might be experiencing some common cold or viral upper respiratory infection (URI) symptoms.

The combination of a runny nose, sore throat, sneezing, and a mild cough could be indicative of several conditions, but the most likely diagnosis would be a viral cold. The severity and duration of your symptoms also suggest that it may not be related to bacterial infections like pneumonia or strep throat (which can cause pharyngitis or tonsillitis).

The fact that you're experiencing these symptoms in combination with a runny nose and sneezing, which is more characteristic of viral infections than bacterial ones, further supports this diagnosis.

Common colds are usually caused by viruses such as rhinoviruses, coronaviruses, or adenoviruses. If your symptoms persist for several days or worsen over time, it's always a good idea to consult with a healthcare professional for proper evaluation and guidance.

In the meantime, here are some tips that might help alleviate your symptoms:

- Stay hydrated by drinking plenty of fluids
- Use saline nasal sprays or drops to help loosen mucus and clear your nose

- Consider using over-the-counter decongestants or pain relievers like acetaminophen or ibuprofen to help manage your symptoms
- Try steam inhalation with a hot shower, inhaling the steam through your hair, or using a humidifier to relieve congestion

Feel better soon!

---

## Q2 — Influenza

**Pregunta:** I suddenly developed a high fever, severe body aches, chills, and a dry cough. What could this be?

### Contexto recuperado (top-5)

- 0.8280 Ornithosis — Signs and symptoms: The incubation period is usually 5 to 14 days, although symptom onset may occasionally occur later. In humans, psittacosis ranges from asymptomatic infection or a mild influenza-like illness to severe atypical pneumonia
- 0.7700 Meningitis, meningococcal — Lead: Meningococcal disease is a serious, vaccine-preventable infection caused by *Neisseria meningitidis*, also known as meningococcus, a Gram-negative diplococcus. Meningococcal disease includes meningitis, meningococcal
- 0.7650 Meningococemia — Lead: Meningococcal disease is a serious, vaccine-preventable infection caused by *Neisseria meningitidis*, also known as meningococcus, a Gram-negative diplococcus. Meningococcal disease includes meningitis, meningococcal septicemia
- 0.7422 Influenza — Signs and symptoms: The symptoms of influenza are similar to those of a cold, although usually more severe and less likely to include a runny nose. The time between exposure to the virus and development of symptoms (the incubation period)
- 0.7335 Constrictive bronchiolitis — Signs and symptoms: Bronchiolitis obliterans results in worsening shortness of breath, wheezing, and a dry cough. The symptoms can start gradually, or severe symptoms can occur suddenly. These symptoms represent an obstru

### Respuesta del sistema

I'm not a doctor, but I can provide some general information to help you identify possible causes of your symptoms. However, please keep in mind that it's always best to consult a medical professional for an accurate diagnosis and proper treatment.

Based on your symptoms, here are a few possibilities:

1. **Influenza:** Your sudden onset of high fever, severe body aches, chills, and dry cough could be indicative of influenza (the flu). The incubation period is typically 1-4 days, but it's always a good idea to see if the symptoms resolve on their own or with some over-the-counter medication.
2. **Bronchiolitis Obliterans:** This condition is also known as Constrictive Bronchiolitis, and it can cause severe respiratory symptoms like shortness of breath, wheezing, and coughing. The dry cough could be related to the obstructive pattern caused by the lung injury or damage.
3. **Viral Pneumonia:** Another possibility is viral pneumonia, which can cause similar symptoms such as high fever, chills, body aches, and dry cough. However, it's essential to note that bacterial infections like pneumonia can also present with similar symptoms.

It's essential to consult a healthcare professional for a proper evaluation and diagnosis. They may ask you questions about your symptoms, medical history, and lifestyle to determine the underlying cause.

In the meantime, here are some general tips:

- If your fever lasts more than 3-4 days or is extremely high (over 104°F/40°C), seek medical attention.

- Take over-the-counter medications like acetaminophen (Tylenol) or ibuprofen (Advil, Motrin) to help manage your symptoms. However, always follow the recommended dosage and consult with a doctor before taking any medication.
- Stay hydrated by drinking plenty of fluids, such as water, clear broths, or electrolyte-rich beverages like sports drinks.

Remember, if you experience any of the following, seek immediate medical attention:

- Difficulty breathing or shortness of breath
- Chest pain or pressure
- Severe headache or confusion
- Vomiting or diarrhea that lasts more than 2 days
- Worsening symptoms despite treatment

Please consult a doctor for a proper evaluation and advice on managing your symptoms.

---

### Q3 — Asthma

**Pregunta:** I get recurring episodes of wheezing, shortness of breath, and chest tightness, especially at night and during exercise. What condition might this be?

#### Contexto recuperado (top-5)

- 0.8976 Asthma — Signs and symptoms: Asthma causes recurrent episodes of wheezing, shortness of breath, chest tightness, and coughing. Symptoms are usually worse at night and in the early morning or in response to exercise or cold air. Some people with asthma
- 0.6717 Asthma — Lead: Asthma is a common long-term inflammatory disease of the airways. It is characterized by variable and recurring symptoms and reduced lung function. Symptoms include episodes of wheezing, coughing, chest tightness, and shortness of brea
- 0.6557 Coronary heart disease — Signs and symptoms: The most common symptom is chest pain or discomfort that occurs regularly with activity, after eating, or at other predictable times; this phenomenon is termed stable angina and is associated with narrowin
- 0.6241 Non-small cell lung cancer — Signs and symptoms: Many of the symptoms of non-small-cell lung cancer can be signs of other diseases, but having chronic or overlapping symptoms may be a signal of the presence of the disease. Some symptoms are indicator
- 0.6043 Spastic angina with healthy coronary artery — Signs and symptoms: Coronary vasospasm classically produces chest pain at rest, also known as variant angina (vasospastic angina or Prinzmetal's angina). Chest pain is more common at certain times of the

#### Respuesta del sistema

Based on your symptoms of recurring episodes of wheezing, shortness of breath, and chest tightness, especially at night and during exercise, it's possible that you may have asthma.

Asthma is a chronic inflammatory disease of the airways characterized by variable and recurring symptoms such as wheezing, coughing, chest tightness, and shortness of breath. Symptoms can be worse at night or with physical activity (exercise), which is consistent with your experiences.

In addition to asthma, it's also possible that you may have other conditions that could be contributing to these symptoms. If you haven't already, it might be worth considering getting a proper diagnosis from a healthcare professional, such as an asthma specialist, who can evaluate your symptoms and provide a accurate diagnosis and treatment plan if necessary.

In the meantime, here are some general tips that might help manage your symptoms:

- Make sure to use your inhaler as prescribed by your doctor, and take it before symptoms worsen.
- Stay hydrated and avoid allergens or irritants that could trigger symptoms.
- Get plenty of rest and try to manage stress.
- Consider using a peak flow meter to track your lung function and monitor changes in your symptoms.

If you experience severe or persistent symptoms, seek medical attention from an emergency department or urgent care center.

---

## Q4 — Migraine

**Pregunta:** I have a severe throbbing headache on one side of my head, along with nausea and sensitivity to light and sound. What might I have?

### Contexto recuperado (top-5)

- 0.8240 Basilar artery migraines — Lead: Migraine is a neurological disorder that causes moderate-to-severe headaches. The pain usually affects one side of the head. It is generally associated with nausea, light sensitivity and sound sensitivity. Other sympt
- 0.8193 Arnold–Chiari malformation — Signs and symptoms: Findings are due to brainstem and lower cranial nerve dysfunction. The onset of symptoms is less likely to be present during adulthood in most patients. Younger children generally have a substantially
- 0.8186 Hydrocephalus - Arnold Chiari - allied disorders — Signs and symptoms: Findings are due to brainstem and lower cranial nerve dysfunction. The onset of symptoms is less likely to be present during adulthood in most patients. Younger children generally
- 0.8184 Chiari type 1 malformation — Signs and symptoms: Findings are due to brainstem and lower cranial nerve dysfunction. The onset of symptoms is less likely to be present during adulthood in most patients. Younger children generally have a substantially
- 0.8165 Migraine — Lead: Migraine is a neurological disorder that causes moderate-to-severe headaches. The pain usually affects one side of the head. It is generally associated with nausea, light sensitivity and sound sensitivity. Other symptoms may include

### Respuesta del sistema

Given your symptoms of a severe throbbing headache on one side of the head, nausea, and sensitivity to light and sound, here are some potential diagnoses:

1. **Migraine:** This is likely, given the combination of symptoms you've described, including a throbbing headache, nausea, and sensitivity to light and sound, which are all common features of migraines.
2. **Sinus Infection or Sinusitis:** If your headache persists despite rest, fluids, and over-the-counter pain relievers, it may be due to a sinus infection or sinusitis. Sinus pressure can cause headaches on one side of the head, and sensitivity to light and sound can also occur.
3. **Tension Headache:** A tension headache is a common type of headache that can be caused by muscle tension in the neck and scalp. It's often accompanied by symptoms like nausea, dizziness, and sensitivity to light and sound, which you've described.
4. **Cluster Headache:** While less likely than migraines or tension headaches, cluster headaches can cause severe, one-sided headaches with similar characteristics to yours.

5. **Hemicrania (also known as Hemicranial Pain Syndrome):** This is a rare condition that causes unilateral pain on one side of the head, often accompanied by nausea and sensitivity to light and sound.

To better determine your diagnosis, I would recommend:

- Consulting with a healthcare professional for a thorough evaluation and possibly an MRI or CT scan to rule out other conditions.
- Keeping a headache diary to track when symptoms occur, their duration, and any potential triggers (e.g., changes in sleep, diet, stress).
- Considering over-the-counter pain relievers like ibuprofen or acetaminophen, as well as prescription medications if needed.

Remember that only a qualified healthcare professional can provide an accurate diagnosis and treatment plan.

---

## Q5 — Gout

**Pregunta:** I woke up with sudden, intense pain, swelling, and redness in my big toe joint. What could be causing this?

### Contexto recuperado (top-5)

- 0.7851 Ainhum — Treatment: Incisions across the groove turned out to be ineffective. Excision of the groove followed by z-plasty could relieve pain and prevent autoamputation in Grade I and Grade II lesions. Grade III lesions are treated with disarticulation
- 0.7200 Hereditary hyperuricemia — Signs and symptoms: Unless high blood levels of uric acid are determined in a clinical laboratory, hyperuricemia may not cause noticeable symptoms in most people. Development of gout – which is a painful, short-term disorder
- 0.7174 Hallux valgus — Lead: A bunion, also known as hallux valgus, is an outward deformity of the foot's metatarsophalangeal joint which connects the big toe to the foot. The rear tarsometatarsal joint that holds the metatarsal bone in a straight-ahead position
- 0.7050 Gout — Signs and symptoms: Gout can present in several ways, although the most common is a recurrent attack of acute inflammatory arthritis (a red, tender, hot, swollen joint). The metatarsophalangeal joint at the base of the big toe is affected most
- 0.6791 Gout — Lead: Gout (GOUT), also called rheumatic gout, is a form of inflammatory arthritis characterized by recurrent attacks of pain in a red, tender, hot, and swollen joint, caused by the deposition of needle-shaped crystals of the monosodium salt

### Respuesta del sistema

Given your symptoms, it's possible that you may have developed gout. Here are some potential causes:

1. **Gout:** The most common cause of acute gout is the deposition of uric acid crystals in a joint, which can lead to inflammation and pain.
2. **Inflammation from diet or medication:** Consuming foods high in purines (e.g., seafood, red meat) or taking certain medications like diuretics, steroids, or NSAIDs may trigger gout attacks.
3. **Dehydration:** Not drinking enough water can cause your body to hold onto excess fluids, leading to swelling and pain.
4. **Sweat and urination:** Excessive sweating and urination can also contribute to dehydration and increase the risk of developing gout.

To alleviate your symptoms, consider:

1. **Over-the-counter pain relievers:** Take an NSAID (e.g., ibuprofen or naproxen) or a colchicine to help reduce inflammation.
2. **Cold compresses:** Apply a cold compress or an ice pack wrapped in a towel to the affected area for 15-20 minutes, several times a day.
3. **Uric acid-lowering medications:** If you have frequent gout attacks, your doctor may recommend taking allopurinol (Zyrtec) or probenecid to help lower uric acid levels.

If your symptoms worsen, change in the severity of the pain, or are accompanied by other concerning signs like high fever, chills, or swelling of other parts of your body, seek medical attention. A healthcare professional can provide a proper diagnosis and treatment plan for you.

---

## Q6 — Hypothyroidism

**Pregunta:** I have been feeling extremely tired, gaining weight, feeling cold all the time, and experiencing constipation. What might I have?

### Contexto recuperado (top-5)

- 0.8106 Proctitis — Signs and symptoms: A common symptom is a continual urge to have a bowel movement—the rectum could feel full or have constipation. Another is tenderness and mild irritation in the rectum and anal region. A serious symptom is pus and blood
- 0.7999 Hyperkalemia — Signs and symptoms: The symptoms of an elevated potassium level are generally few and nonspecific. Nonspecific symptoms may include feeling tired, numbness, and weakness. Occasionally, palpitations and shortness of breath may occur. Hy
- 0.7882 Hand, foot and mouth disease — Signs and symptoms: Common constitutional signs and symptoms of HFMD include fever, nausea, vomiting, feeling tired, generalized discomfort, loss of appetite, and irritability in infants and toddlers. Skin lesions frequ
- 0.7755 Vasovagal syncope — Signs and symptoms: Episodes of vasovagal syncope are typically recurrent and usually occur when the predisposed person is exposed to a specific trigger. Before losing consciousness, the individual frequently experiences early sig
- 0.7474 Sjögren's syndrome — Signs and symptoms: In a 2021 article on Sjögren's patients, a majority of individuals stated that eight symptoms had a major or moderate impact on their life: fatigue (79%); dry eyes (75%); dry mouth (73%); joint pain (65%); tro

### Respuesta del sistema

Based on your symptoms, it's possible that you may be experiencing hypothyroidism, a condition where the thyroid gland doesn't produce enough hormones, leading to fatigue, weight gain, dry skin, and other issues.

Here are some potential causes of these symptoms:

1. **Hypothyroidism:** As mentioned earlier, this is a common cause of constipation, fatigue, and weight gain.
2. **Polycystic Ovary Syndrome (PCOS):** This hormonal disorder can cause weight gain, fatigue, dry skin, and constipation due to hormonal imbalances.
3. **Adrenal insufficiency:** This condition can lead to fatigue, weight gain, cold intolerance, and constipation due to hormone deficiencies.
4. **Diabetes:** Both type 1 and type 2 diabetes can cause fatigue, weight gain, and constipation due to insulin resistance or inadequate insulin production.

To determine the exact cause of your symptoms, it's essential to consult a healthcare professional for a proper diagnosis and testing (e.g., blood tests, thyroid function tests).

In the meantime, here are some general tips that may help alleviate your symptoms:

1. **Get enough sleep:** Aim for 7-8 hours of sleep per night to help regulate your metabolism.
2. **Stay hydrated:** Drink plenty of water throughout the day to help with digestion and constipation.
3. **Exercise regularly:** Regular physical activity can help boost energy levels, but avoid overexertion that may exacerbate fatigue.
4. **Eat a balanced diet:** Focus on whole foods, fruits, vegetables, whole grains, lean proteins, and healthy fats to support overall health.

Please consult with your healthcare provider for personalized guidance and treatment.

---

## Q7 — Pneumonia

**Pregunta:** I have a fever, sharp chest pain that worsens when I breathe deeply, a productive cough, and difficulty breathing. What illness might this be?

### Contexto recuperado (top-5)

- 0.8483 Pneumonia — Signs and symptoms: People with infectious pneumonia often have a productive cough, fever accompanied by shaking chills, shortness of breath, sharp or stabbing chest pain during deep breaths, and an increased rate of breathing. In elderly
- 0.8344 Pleuritis — Lead: Pleurisy, also known as pleuritis, is inflammation of the membranes that surround the lungs and line the chest cavity (pleurae). This can result in a sharp chest pain while breathing. Occasionally the pain may be a constant dull ach
- 0.8318 Aspergillosis — Signs and symptoms: A fungus ball in the lungs may cause no symptoms and may be discovered only with a chest X-ray, or it may cause repeated coughing up of blood, chest pain, and occasionally severe, even fatal, bleeding. A rapidly in
- 0.8286 Pleurisy — Lead: Pleurisy, also known as pleuritis, is inflammation of the membranes that surround the lungs and line the chest cavity (pleurae). This can result in a sharp chest pain while breathing. Occasionally the pain may be a constant dull ache
- 0.7300 Pneumonia — Lead: Pneumonia is an inflammatory condition of the lung primarily affecting the small air sacs known as alveoli. Symptoms typically include some combination of productive or dry cough, chest pain, fever, and difficulty breathing. The sev

### Respuesta del sistema

Based on your symptoms, it appears that you may be experiencing pneumonia. The combination of a fever, sharp chest pain, productive cough, and difficulty breathing is consistent with this diagnosis.

Pneumonia is an inflammatory condition of the lung that can cause a range of symptoms, including:

- Fever (usually due to infection)
- Sharp or stabbing chest pain that worsens when you breathe deeply
- Productive cough, which is a coughing up of mucus or other material from the lungs
- Difficulty breathing, which can be due to inflammation of the air sacs in the lung

Other possible causes of these symptoms could include:

- Bronchitis: an inflammation of one or more of the airways, often caused by infection.
- Sinusitis: an infection of the sinuses, which can cause fever, cough, and difficulty breathing.
- Acute bronchiolitis: a viral or bacterial infection that inflames the small airways in the lung.

However, based on your symptoms, pneumonia is a likely diagnosis.

---

## Q8 — Rheumatoid arthritis

**Pregunta:** My joints are swollen and painful, especially in the mornings, and the morning stiffness lasts for more than an hour. The same joints on both sides of my body are affected. What could I have?

### Contexto recuperado (top-5)

- 0.8540 Arthritis, juvenile — Signs and symptoms: Arthritis entails inflammation within the joint, and presents as swelling, pain, stiffness and restricted joint movement. Symptoms of JIA vary. This is because JIA has several subtypes, which differ according
- 0.8491 Juvenile rheumatoid arthritis — Signs and symptoms: Arthritis entails inflammation within the joint, and presents as swelling, pain, stiffness and restricted joint movement. Symptoms of JIA vary. This is because JIA has several subtypes, which differ
- 0.8239 Osteoarthritis — Signs and symptoms: The main symptom of osteoarthritis is pain, causing loss of ability and often stiffness. The pain is typically made worse by prolonged activity and relieved by rest. Stiffness is most common in the morning, and ty
- 0.7982 Hypertrophic osteoarthropathy, primary or idiopathic — Lead: Hypertrophic osteoarthropathy is a medical condition combining clubbing and periostitis of the small hand joints, especially the distal interphalangeal joints and the metacarpophalangeal jo
- 0.7893 Rheumatoid arthritis — Lead: Rheumatoid arthritis (RA) is a long-term autoimmune disorder that primarily affects joints. It typically results in warm, swollen, and painful joints. Pain and stiffness often worsen following rest. Most commonly, the wri

### Respuesta del sistema

Based on your symptoms, it sounds like you may be experiencing joint pain and swelling, particularly in the mornings. This is consistent with several potential conditions. Here are a few possibilities to consider:

1. **Osteoarthritis (OA):** OA is a common condition that affects joints throughout the body. It's characterized by cartilage breakdown and joint inflammation, leading to pain, stiffness, and swelling, especially in the mornings.
2. **Rheumatoid Arthritis (RA):** While you've mentioned that your symptoms are similar to RA, it's essential to note that RA typically has a different onset and progression pattern. However, if you experience morning stiffness lasting more than an hour, it could be related to RA or another inflammatory condition.
3. **Arthritis subtypes:** As I mentioned earlier, there are several arthritis subtypes, including juvenile rheumatoid arthritis (JIA), osteoarthritis, and others. Each subtype can present differently, but the morning stiffness and swelling could be indicative of a few different conditions.

To better diagnose your symptoms, it's recommended that you consult with a healthcare professional, such as an orthopedist or a primary care physician. They will likely perform a thorough examination, including:

- Reviewing your medical history
- Taking a physical exam to assess joint mobility and pain
- Asking about medications and any potential allergies
- Ordering imaging tests (e.g., X-rays, ultrasound) to rule out other conditions

Your healthcare provider may recommend the following steps:

- A physical exam to evaluate joint mobility, pain, and swelling
- Imaging tests (X-rays, ultrasound) to assess joint damage or inflammation

- Laboratory tests (blood work) to check for underlying conditions, such as anemia or infection
- A comprehensive diagnosis and treatment plan tailored to your specific needs

In the meantime, here are some general tips that may help alleviate your symptoms:

- Over-the-counter pain relievers like ibuprofen or acetaminophen may help manage pain and inflammation.
- Applying heat or cold packs to the affected joints may provide temporary relief from stiffness and pain.
- Maintaining a consistent sleep schedule and engaging in regular exercise can help reduce morning stiffness.

Remember, it's essential to consult with a healthcare professional to determine the underlying cause of your symptoms and develop an effective treatment plan.

## Respuesta del sistema

Based on your symptoms of:

- Persistent cough that produces blood
- Night sweats
- Weight loss without effort

I would like to rule out some potential illnesses first before suggesting a diagnosis.

Given your symptoms, it's possible that you might have conditions affecting the respiratory or infectious systems. However, I'll focus on more likely causes for these specific complaints:

1. **Coughing up blood:** This symptom suggests that something is causing an infection or inflammation in your airways, which could be viral, bacterial, or postnasal drip-related.
2. **Night sweats:** These occur when your body temperature increases excessively at night, often due to illness, stress, or hormonal changes.

Considering these symptoms, here are some potential diagnoses that come to mind:

1. **Acute bronchitis:** This is an inflammation of the airways caused by a viral or bacterial infection, leading to coughing up blood (hemoptysis). Night sweats might also occur due to increased body temperature.
2. **Viral pneumonia:** Similar to acute bronchitis, this would explain your cough with blood production and night sweats. However, it's essential to rule out other potential causes of respiratory infections before making a diagnosis.
3. **Postnasal drip-related conditions:** Conditions like allergies, sinusitis, or cystic fibrosis can cause postnasal drip, leading to persistent coughing up blood.

To better determine the cause of your symptoms, I recommend consulting with your doctor or healthcare provider. They may perform:

- Nasal swab to check for viral or bacterial infections
- Chest X-ray to rule out pneumonia
- Blood tests to check for inflammation or infection markers
- Physical examination and medical history review

In the meantime, you can try some general self-care measures:

- Stay hydrated with plenty of fluids
- Use a humidifier to relieve postnasal drip
- Practice good sleep hygiene to reduce stress
- Try over-the-counter medications like decongestants or pain relievers as needed.

Please consult with your doctor for a proper evaluation and diagnosis.
